

Project Specification Document

Flow Chart for Program

Core concepts used in the project

Concepts used in developing the application are

- Variables
- Collections
- Data structures
- Threads
- Exceptions
- Class
- Methods
- Objects
- Built-in packages
- Files handling
- Algorithms – sort and search

Conclusion and USP:

- Application is responsible for functioning of user specific actions; it does represent the features like listing out and displaying all files in ascending order from a specified directory. Create, delete and search a file by taking the user defined names from a console result. Application is purely based on console type which takes inputs from the user.
- Techniques used in the application are not much time taking and are not very complex, application features can be easily understandable for all types of users. It is very cost-efficient and delivers very good outcomes
